TO WHOM IT MAY CONCERN

We are pleased to confirm that over the course of the last 4 months LBNiW has successfully completed numerous non-destructive examinations of welds during the construction of Botnia's Pulp Mill in Fray Bentos, Uruguay.

LBNiW conducted weld testing of various carbon steel and stainless steel storage tanks that KRESTA erected on the site. All examinations have been performed according to the respective European standards by use of ultrasonic testing (UT), radiographic testing (RT) and penetrant testing (PT).

KRESTA is very satisfied with the quality of services provided by LBNiW. At all times ndt personnel and in particular their project manager was very responsive to the needs of KRESTA and the project schedule. Their certified inspectors have been competent, cooperative, and knowledgeable. The testing documentation has been prepared accurately and professionally which was confirmed by ANDRITZ's quality assurance team.

It has been a pleasure working with LBNiW and we are looking forward to working with them in the future. We have no hesitation in recommending LBNiW as an experienced NDT contractor for similar projects.
